Ms. Michelle Arsenault Advisory Committee Specialist National Organic Standards Board USDA-AMS-NOP 1400 Independence Ave. SW Room 2648-S Mail Stop 0268 Washington, DC 20250-0268

Dear Ms. Arsenault,

RE: Docket Number: AMS-NOP-16-0100 Notice of Meeting of the National Organic Standards Board

The Northwest Horticultural Council (NHC) appreciates the opportunity to comment on the upcoming Sunset Review of organic materials listed in the most recent National Organic Standards Board (NOSB) Materials Report.

The NHC represents growers, packers, and shippers of apples, pears, and cherries both conventional and organic, in the states of Idaho, Oregon, and Washington on regulatory issues of federal and international policy.

The Pacific Northwest is the national leader in the production of organic apples, pears, and cherries. Over 12 million boxes of organic apples are now harvested from more than 21,000 acres in Washington state, amounting to over 90 percent of the entire organic apple crop in the United States. There is also a significant amount of organic pears and cherries grown in our region, with more than 4,100 acres planted across the Pacific Northwest. Organic tree-fruit production in the Pacific Northwest is increasing, with additional acreage being transitioned to organic each year.

In many ways, this region is the epicenter for organic pome fruit and cherry production in the United States. The total organic tree-fruit crop for the region topped \$463 million in 2015, of which organic apples alone accounted for approximately \$398 million. In fact, tree-fruit accounted for 60% of farm gate sales for all Washington state organics that year.

We have compiled a list of materials from those listed by the NOSB for review that are of particular importance to organic tree-fruit growers and packers. Below you will find this list complete with NOSB citation and a brief description of the item's standard usage and a statement as to why the product is needed.

Crops

Chlorine-based products are critical tools for the tree-fruit industry in both the orchard and packinghouse setting. They are vital to reducing the presence of naturally-occurring pathogens that can pose significant health hazards for consumers, and may be found in the orchard and therefore may enter a packinghouse. As you consider allowing the continued use of each of these chlorine-based products, please consider the new requirements for sanitizing equipment and tools that will soon be imposed on all tree-fruit growers and packers though the Food Safety Modernization Act. Paracetic acid is currently the only other widely-used sanitizer permissible under the National Organic Program, and reliance on a single sanitizer can lead to resistance development by pathogens. We strongly support the continued use of these vital tools for equipment and water sanitation purposes.

- Calcium Hypochlorite (citation 205.601(a)) Calcium hypochlorite is used as an algaecide, disinfectant, and sanitizer (including for irrigation system cleaning). It is an important tool for the sanitation of water used during crop production and is critical to reducing cross-contamination of naturally-occurring human health pathogens such as *E.coli* and *Listeria monocytogenes*. It can be used to sterilize equipment that is used for fire blight removal in organic orchards to aid in the prevention of the spread of this disease. This product is used by many organic tree-fruit growers.
- Chlorine Dioxide (citation 205.601(a)) Chlorine dioxide is also used as an algaecide, disinfectant, and sanitizer (including to clean irrigation systems). It is used by almost 100% of organic tree-fruit growers in the region.
- Sodium Hypochlorite (citation 205.601(a)) Sodium hypochlorite is used as a sanitizer for purposes including irrigation system cleaning. It is used to sanitize work preparation surfaces in the field, as well as harvest containers such as buckets, totes, bins, and boxes. It can also be used to sterilize pruning equipment used for fire blight removal in organic orchards to aid in the prevention of the spread of this disease. It is used by nearly 100% of organic tree-fruit growers in the region.
- Soap Based Herbicides (citation 205.601(b)) Soap-based herbicides are used to kill weeds around roadways, ditches, and building perimeters. It is a broad-spectrum weed control used early in the weed cycle. It replaces mechanical weeding that can be harmful to beneficial soil insects. It also replaces propane flamers that can pose a fire hazard around fences and buildings. It is used on an as needed basis among Pacific Northwest organic tree-fruit growers.
- **Biodegradable bio-based mulch (citation 205.601(b))** Biodegradable bio-based mulch is used as an herbicide and weed barrier. It provides a versatile approach to combat a broad spectrum of weeds that are difficult to control. While we support this continued listing, we would also ask that the NOSB provide clarity as to exactly what forms of these materials will be allowed for use.
- Sticky Traps/Barriers (citation 205.601(e)) Sticky traps/barriers are used by organic tree-fruit growers for monitoring and controlling codling moth, apple maggot, and western cherry fruit fly. They are a valuable tool in controlling these pests that often pose a significant threat to organic

tree-fruit production. Loss of these materials would be catastrophic to the tree-fruit industry. Sticky traps are used by 100% of organic tree-fruit growers.

- Copper sulfate (citation 205.601(i)) Copper sulfate is a fungicide that is used for plant disease control. It is used to treat fire blight in apple and pear production. With the loss of streptomycin and oxytetracycline, copper sulfate has become an even more vital tool in treating fire blight and apple scab in apple and pear production. Coppers are typically applied prior to harvest and are not overly applied. Soil, leaf, and fruit testing are used to ensure that copper sulfate is used in a manner that minimizes accumulation of copper in the soil as to not cause toxicity build-up.
- Coppers, fixed (citation 205.601(i)) Fixed copper is used as a fungicide for control of fire blight in apple and pear production as well as in treating bacterial cankers and Gummosis of sweet cherry trees. Importance of fixed copper usage has increased for fire blight control in organic apple and pear production since the loss of streptomycin and oxytetracyline. Copper accumulation in the soil is properly minimized by testing soil, leaf, and fruit. It is estimated that almost 100% of organic tree-fruit growers in our region use this product.
- Humic acids (citation 205.601(j)) Humic acid is used as a plant or soil amendment. It promotes better soil, which in turn promotes root health for the tree, and is a good stimulant for soil microbes, helping the plant utilize other nutrients and thereby enhancing the quality of the fruit and overall soil and plant health. It is estimated that nearly 100% of organic tree-fruit growers use this product.
- Soluble boron (citation 205.601(j)) Soluble boron is a plant micronutrient that is essential for plant growth and development. Use of this substance in the orchard improves fruit health and quality, improving the fruit's storability and reducing the probability of post-harvest physiological disorders in handling. This product is extensively used in the tree-fruit industry.
- Micronutrients: Sulfates, carbonates, oxides, or silicates of zinc, iron, manganese, molybdenum, selenium, and cobalt. (citation 205.601(j)(6) (ii)) Micronutrients are used as a foliar spray or as a ground-applied nutrient for apples, pears, and cherries. They supplement ground nutrients and aid with soil and plant health needs. These products are used extensively by organic tree-fruit growers, but at low rates applied per application.

Handling

- Nitrogen (citation 205.605(a)) Nitrogen is used in cold room facilities to displace oxygen. Proper storage of tree-fruit is essential to maintaining fruit quality until it reaches the consumer. This product is used considerably by the organic tree-fruit industry.
- Acidified sodium chlorite (citation 205.605(b)) Acidified sodium chlorite is a secondary direct antimicrobial food treatment and indirect food contact surface sanitizer. It is one of several

sanitizers and disinfectants used throughout organic handling facilities to control food-borne pathogens to protect consumer health and comply with FSMA.

• Calcium hypochlorite (citation 205.605(b)) - Chlorine dioxide is used as an algaecide, disinfectant, and sanitizer. It is used in packinghouses to treat process water, sanitize hard surfaces, and as a fruit wash. It is used by 100% of organic fruit handling (packing) operations in the region.

• Chlorine dioxide (citation 205.605(b)) - Chlorine dioxide is used for disinfecting and sanitizing food contact surfaces. It is also used as a fruit rinse, and in dump tanks. It can be used to sanitize storage rooms prior to use. Its use is universal in commercial organic tree-fruit handling facilities.

• Sodium hypochlorite (citation 205.605(b)) - Sodium hypochlorite is used to disinfect and sanitize food contact surfaces. It is commonly used in packinghouse dump tanks as a disinfectant.

Conclusion

These products are important – and in some cases critical – to organic tree-fruit production. The loss of these products would negatively impact our organic tree-fruit growers and packers. Removal of these substances could consequently force our local organic tree-fruit growers and packers out of organic production. We ask that members of the board consider their decision carefully while recognizing the importance of these materials, both for the important role each plays in organic tree-fruit production but also to preserve management options necessary to respond to food safety concerns and operational needs in organic production and packing.

Thank you for your careful consideration of these comments.

Sincerely,

NORTHWEST HORTICULTURAL COUNCIL
